

Conditional Statement

1. **Largest among Three Numbers:** Write a Python program that takes three numbers as input and prints out the largest among them.
2. **Quadrant Identifier:** Write a Python program that takes the coordinates (x, y) of a point as input and prints out which quadrant it belongs to (1st, 2nd, 3rd, or 4th).
3. **Age Classifier:** Write a Python program that takes a person's age as input and prints out whether they are an infant (0-1), toddler (2-3), child (4-12), teenager (13-19), adult (20+).
4. **BMI Calculator:** Write a Python program that takes a person's height (in meters) and weight (in kilograms) as input and calculates their Body Mass Index (BMI). Print out their BMI and a message indicating whether they are underweight (<18.5), normal (18.5-24.9), overweight (25-29.9), or obese (>=30).
5. **Temperature Converter:** Write a Python program that takes a temperature input in Celsius and converts it to Fahrenheit if the temperature is above 0°C, or to Kelvin if the temperature is below 0°C.
6. **Simple Calculator:** Input two numbers and an operator (+, -, *, /). Use `if-elif` to perform the operation and print the result. Handle division by zero using conditions.

Loops

1. **FizzBuzz:** Write a Python program that prints the numbers from 1 to 100. But for multiples of three, print "Fizz" instead of the number, and for the multiples of five, print "Buzz". For numbers that are multiples of both three and five, print "FizzBuzz" using a for loop.
2. **Armstrong Number Checker:** Write a Python program that takes an integer input from the user and checks if it is an Armstrong number (a number that is equal to the sum of its own digits raised to the power of the number of digits) using a for loop.
3. **Number Reverser:** Write a Python program that takes an integer input from the user and prints its reverse using a while loop.
4. **Sum of Digits:** Write a Python program that takes an integer input from the

user and calculates the sum of its digits using a while loop.

5. Print the pattern (for/while):

```
1
22
333
4444
55555
```

6. Fibonacci Sequence (for loop): Input N. Print the first N terms of the Fibonacci sequence.

7. Password Retry System (while loop) : Predefined password. Let user try until correct or after 3 failed attempts show "Account locked"

8. Guess the Number Game (while loop): Consider a random number between 1 and 10. Let user guess until correct. Give hints: "Too high" or "Too low".
